

Project Design Phase

Problem – Solution Fit Template

Date	26 July 2026
Name:	Sakhamuri Ruthvick Sai
Project Name:	Automated Network Request Management System
Maximum Marks:	2 Marks

1. Visual Artifact: Problem-Solution Fit Canvas

Below is the structured visual canvas summarizing the alignment between customer friction points and the automated ServiceNow technical solution architecture.

7. VALUE PROPOSITION: PDLM (DIGITAL LEGACY CORE)		9. CUSTOMER PAINS		1. CUST. SEGMENT (DIGITAL ANCHORS)			
Unified Digital Asset Ledger [cite: whitepaper_v2.pdf]; Integrated Trust Protocols [cite: trust_framework.png]; Key Custody and Vaulting [cite: crypto_vault.png]; Automated Heir Notification Flow Designer [cite: process_automation.png]; Legal Compliance Assurance persistence [cite: legal_docs.png].		Fear of losing family digital history [cite: family_legacy.pdf]; Clerical burden of managing dozens of logins [cite: admin_fatigue.png]; Anxiety over unsecured data theft.		Primary: Adults over 45, families, people with large digital footprints (content creators, crypto holders), seeking control. (cite: user_persona_report.pdf, image_data_policy.png, 2)			
4. DIGITALLY HARD TASKS		3. DIGITAL PANIC SITUATIONS		2. DIGITAL BEHAVIOR (PRE-PDLM)			
Centralizing all digital asset credentials and keys [cite: 3]	Finding legal authority to transfer non-traditional assets. Manually auditing every online account for status.	Loss of irreplaceable sentimental data (family photos/videos) Inactive crypto assets becoming permanently locked.	Password retrieval nightmares for heirs [cite: legacy_challenges.pdf] Isolation of family members from real-time asset visibility.	Hiding critical passwords in unsecured text files [cite: image_f9405a.png] Using dozens of single-purpose legacy apps without central linkage.	Fragmented account logins spread across social, email, banking, and crypto.		
8. GAIN CREATORS & PAIN RELIEVERS		10. EMOTIONAL IMPACT (POST-PDLM)		5. UNIFIED PROBLEM ROOT CAUSE		6. ACCESS CHANNEL & MESSAGE	
Unified vault provides peace of mind. Simplifies heir retrieval process. Crypto asset recovery tools.	Automated 'Proof-of-Life' checks eliminate uncertainty. Reduces emotional burden of digital closure. Prevent data decay.	Restores confidence in digital future-proofing; eliminates administrative dread; ensures essential asset stability and family connectivity exactly when critical life moments occur.		Siloed data platforms lack direct protocol for secure, authenticated cross-account transfer on trigger events (cite: cross-platform_access.pdf); no centralized trust authority for digital inheritance.		Accessible directly on a secure, encrypted mobile app & web portal [cite: security_architecture.png]; message: "Secure your digital future with full heir visibility in under 5 minutes." [cite: 4]	

Theoretical Breakdown of the 10 Core Nodes

1. Customer Segment (CS)

- The Theory: In enterprise systems, the "customer" is an internal persona categorized by technical literacy, organizational tier, and operational dependency. This quadrant relies on Empathy Mapping to define who suffers when a workflow breaks down.
- Application: Targets the standard enterprise user (non-technical corporate staff) caught in macro organizational changes (migrations), highlighting that the system must serve the lowest common denominator of technical capability.

2. Customer Behavior (CB)

- The Theory: This captures the Current State User Journey (As-Is). It documents the unoptimized, manual steps an employee naturally defaults to due to an inadequate system interface.
- Application: Documents "shadow work"—manually scanning wikis and relying on fragmented peer-to-peer communication channels (Teams/Slack) rather than a centralized record.

3. Unfavorable Situations (US)

- The Theory: The worst-case operational scenario or the "blast radius" of process failure. This defines the exact point where system inefficiency results in direct business financial loss or a total drop in employee output.
- Application: Points to the operational standstill on "moving day." If IT asset coordination lags behind physical real estate allocation, human capital is wasted.

4. "Hard to do" Tasks / Problems (HP)

- The Theory: Isolates cognitive load and clerical friction points. It differentiates between systemic issues and the precise day-to-day tasks that exhaust user patience and introduce data corruption.
- Application: Pinpoints the manual entry of complex data schemas (grid vectors, serial numbers) into unvalidated text inputs—a breeding ground for human error.

5. Problem Root Cause (RC)

- The Theory: The technical limitation causing the behavioral workarounds. This shifts the focus from human error to architectural debt, identifying exactly where backend data silos or lack of API integrations fail the user.
- Application: Explains that the old application acts as a dumb data-dump container without hooks into the user registry (sys_user), automated workflow layers, or dynamic presentation policies.

6. Behaviors (B) / Workarounds

- The Theory: Explores systemic defense mechanisms. When standard channels break, users invent bypasses to force human intervention, inadvertently overloading support teams and corrupting operational metrics.
- Application: Explains why help desks are flooded with duplicate "high priority" tickets and off-record direct messages, skewing actual IT performance analytics.

7. Triggers (TR)

- The Theory: The macro catalyst or business event that forces the user to interact with the system. Triggers are typically external organizational directives rather than spontaneous user desires.

- Application: Identifies systemic catalysts like corporate scaling, physical real estate reallocations, and mandatory hardware compliance deadlines.

8. Your Solution (YS)

- The Theory: The Target State Architecture (To-Be). It demonstrates how modern engine platforms resolve root causes through automation, validation layers, dynamic policy routing, and structured database writes.
- Application: Leverages the ServiceNow framework (Client Scripts, UI Policies, Flow Designer, and custom ledger tables like u_network_database) to completely automate data validation and approval pipelines.

9. Channel & Message (CM)

- The Theory: Internal marketing and UX positioning. Even perfect technical solutions fail without proper discoverability (where the user naturally goes) and a clear, time-bound value proposition that drives adoption.
- Application: Locates the service precisely on the core Employee Center Portal homepage, promising an unambiguous, friction-free turnaround time ("under a minute").

10. Emotional Driver / Impact (ED)

- The Theory: The downstream psychological return on investment (ROI). Reversing negative emotional states (anxiety, confusion) into positive ones (trust, predictability) drastically increases platform engagement and operational compliance.
- Application: Transitions the employee experience from moving-day anxiety to administrative confidence, cementing trust in institutional IT stability.
