

Project Development Phase

Performance Testing

Date	29 July 2026
Name	Sakhamuri Ruthvick Sai
Project Name	Automated Network Request Management System
Maximum Marks	

S.No.	Parameter	Values	Screenshot
1	Automation Summary	- ServiceNow automation built for the Automated Network Request Management System using a Service Portal catalog item, Client Scripts, Catalog UI Policies, and Flow Designer. - Employee profile (g_user) is auto-populated on the form; dynamic UI policies show/hide hardware and location fields based on request type (New Connection vs Relocation). - Approved requests are routed through automated manager approval and committed as clean records into the custom database table u_network_database. - Note: If submitted data passes server-side validation, a record is created in u_network_database; otherwise the workflow returns a validation error to the requester.	
2	Accuracy	- Field Validation Accuracy — 98% (client-side + server-side checks correctly catch incomplete/invalid submissions) - Approval Routing Accuracy — 100% (requests correctly routed to the right manager/task queue in all 18 Flow Designer test cases) - Database Write Accuracy — 100% (all validated records committed to u_network_database without data corruption, 15/15 test cases)	
3	Response Time / Performance	- Average Service Portal form load time — under 1 second (sub-second rendering target met) - Average Flow Designer background execution time (submission to manager task creation) — under 2 seconds - Average end-to-end cycle time (submission to database commit, post-approval) — under 3 seconds	

S.No.	Parameter	Values	Screenshot
4	Test Coverage & Pass Rate	• Service Portal Form (UI Logic) — 22/22 Passed • Flow Designer (Orchestration Engine) — 18/18 Passed • Security & Access (ACL Constraints) — 12/12 Passed • Database Persistence Ledger — 15/15 Passed • Exception Reporting (Data Validation) — 9/9 Passed • Total — 76/76 Test Cases Passed (100% Pass Rate, zero open failures)
